

Environmental Information

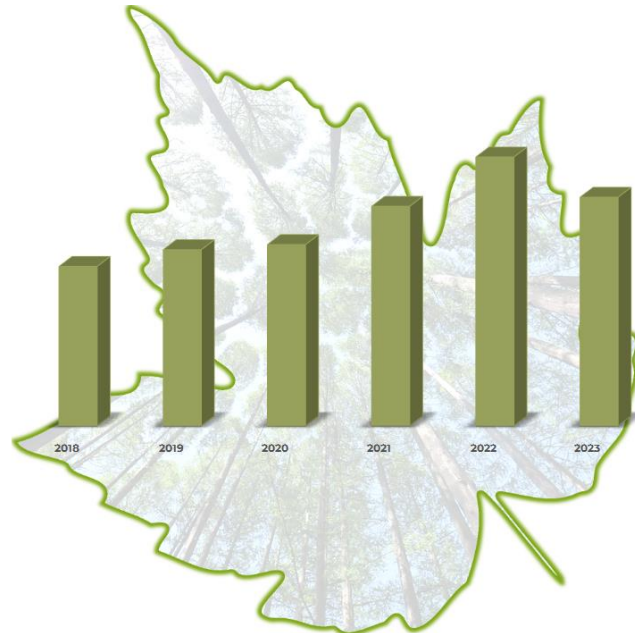

At Agefred, we are committed to reducing our environmental impact and have a policy aligned with ISO 14001 and ISO 50001 standards to achieve this.

Our goal for this year is to implement a formal measurement of our carbon footprint, structuring an analysis that we have already begun developing.

In 2023, we have achieved approximately a 25% reduction in total emissions compared to the previous year, partly due to optimizing electricity use, including the adoption of low-consumption technology, constant monitoring of our energy expenditure, and improving internal processes to minimize electricity waste.

We are promoting the use of waste managers that prioritize reuse and recovery, transforming our waste into usable resources and thus contributing to a more circular and sustainable economy.

We will continue to improve and transform our processes to achieve the goal of carbon neutrality.
